

Unmanned Aircraft System Traffic Management (UTM)

NEXTGEN

Dr. Marcus Johnson

NASA Ames Research Center

December 2017

FAA Small UAS forecast – 7M total, 2.6M commercial by 2020

Vehicles are automated and airspace integration is necessary

New entrants desire access and flexibility for operations

Current users want to ensure safety and continued access

Regulators need a way to put safety structures in airspace

Operational concept being developed to address beyond-visual-line-of-sight (BVLOS) UAS operations at low altitude in uncontrolled airspace using UTM construct

Challenges with Expanding Operations

Visual Line of Sight

14 CFR Part 101(e) [Hobbyists]
14 CFR Part 107 [Commercial]

No Operations over People
Daylight Only
Up to 400 ft AGL
Operation in controlled
airspace allowed

Operations Near Airports

Command and Control

Aircraft Performance

Tracking and UAS Identification

Beyond Visual Line of Sight

Separation

Weather

Awareness

Operations over People

What is UAS Traffic Management? _____

UTM is an “air traffic management” ecosystem for uncontrolled airspace

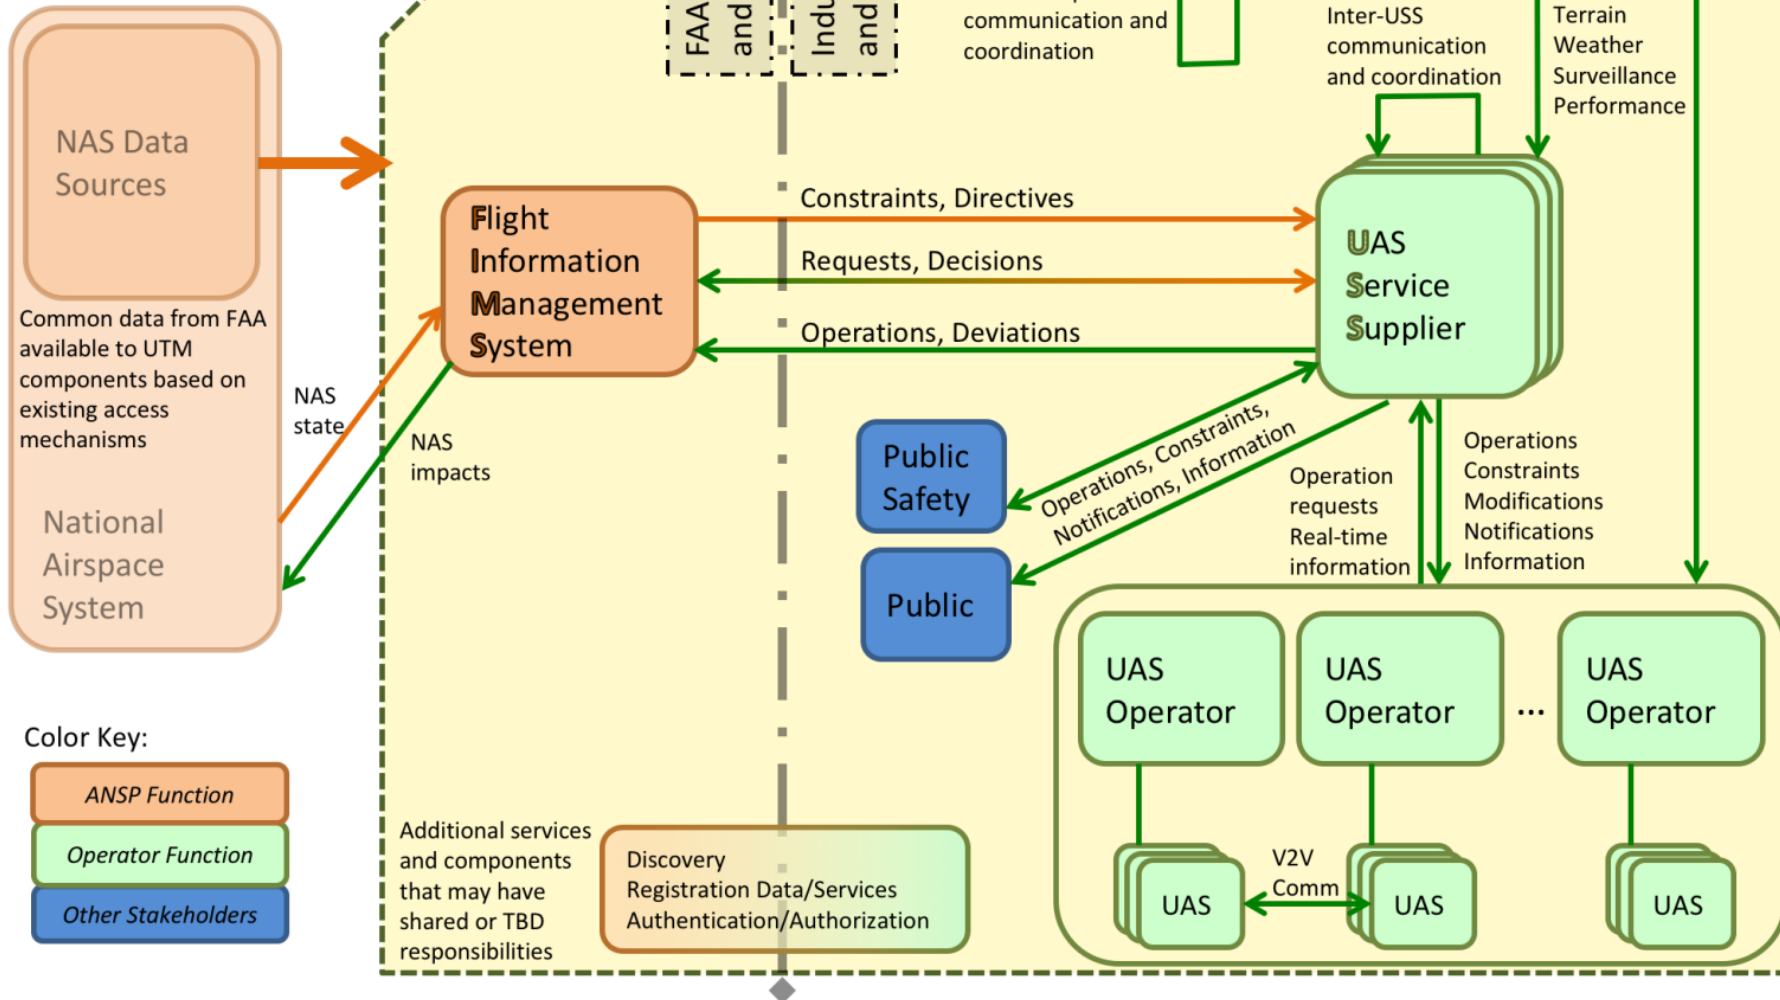

UTM utilizes industry's ability to supply services under FAA's regulatory authority where these services do not exist

UTM development will ultimately identify services, roles/responsibilities, information architecture, data exchange protocols, software functions, infrastructure, and performance requirements to enable the management of low-altitude uncontrolled UAS operations

UTM addresses critical gaps associated with lack of support for UAS operations in uncontrolled airspace

UTM Architecture

v2017.08.31

Flight Information Management System

- Enables airspace controls
- Facilitates requests
- Supports response in emergencies impacting NAS

UAS Service Supplier

- Federated Structure
- Cloud-based system
- Automated System
- Supports UAS with services (e.g. separation, weather, flight planning, contingency management,, etc.)

Supplemental Data Service Provider

- Supplies supplemental data to USS and UAS Operator to support operations

UAS / UAS Operator

- Individual Operator
- Fleet Management
- On-board capabilities to support safe operations

Technical Capability Level (TCL) Progression

TCL1: *multiple VLOS*

- Networked Operations
- Info sharing

TCL2: *multiple BVLOS, rural*

- Initial BVLOS
- Intent sharing
- Separation by geo-fencing

TCL3: *multiple BVLOS, near airports, suburban*

- Routine BVLOS
- Detect and Avoid (DAA) / Vehicle to Vehicle (V2V)
- Avoid static obstacles

TCL4: *complex urban BVLOS*

- BVLOS to doorstep
- Track and locate
- Avoiding dynamic obstacles
- Large scale contingencies

Technical Capability Level 2 Flight Test

Evaluate the feasibility of multiple BVLOS operations using a UTM research platform

Flight Test Overview

Operational Area

UAS Range

Elevation: 5050 feet

Desert Terrain

Missions up to 500 ft

Operations at 5 Locations

SRHawk
Radar

Weather
Equipment

LSTAR Radar

Nevada UAS Test Range

October 2016

TCL 2 UTM Functionality

UTM Mobile Application

Scheduling and Planning, Tracking, and Contingency Management

Flight Test Highlights

Situation Awareness Displays

Critical alerts, operational plan information and map displays

Altitude Stratified Operations

Live-Virtual Constructive Environment

BVLOS

Visual Line of Sight

Simultaneous Operations

Flights

UAS Vehicles

Partnerships

Scenarios

TCL 2 Flight Test Lessons Learned

Inconsistent Altitude Reporting

Increased risk of controlled flight into terrain and airborne collision hazard

Altitude reporting should be consistent or translatable across airspace users

Weather Impact on UAS

Nominal Aircraft Endurance

Multi-Rotors: 20-40 minutes

Fixed-Wing: 45-200+ minutes

Reno-Stead Elevation: 5,050 ft

Cool Temperatures

Density Altitude: 4,000 ft

Winds: 5-35 knots

Aircraft encountered **thermals**, **microbursts** and **high winds** which resulted in **reduced endurance** and degraded flight plan conformance

Warm Temperatures

Density Altitude: 9,000+ ft

Winds: 5-15 knots

Aircraft experienced substantially **shorter endurance**

UAS should be tested and rated against different operational environments

Recommendations for BVLOS Operations

1

Operators should **display airspace information** and have access to other operator's operational intent and contingency actions in off-nominal conditions

2

Altitude reporting should be **standardized** and consistent/translatable to current airspace users

3

In the absence of acceptable weather products, **atmospheric conditions** should be **self-reported from GCS and UAS**

4

Initial BVLOS should **avoid altitude stratification**, until improved position sharing (e.g. V2V) and weather products

5

Flight trajectories should be **contained within geo-fence boundaries** that are shared with the UTM research platform **to support separation**

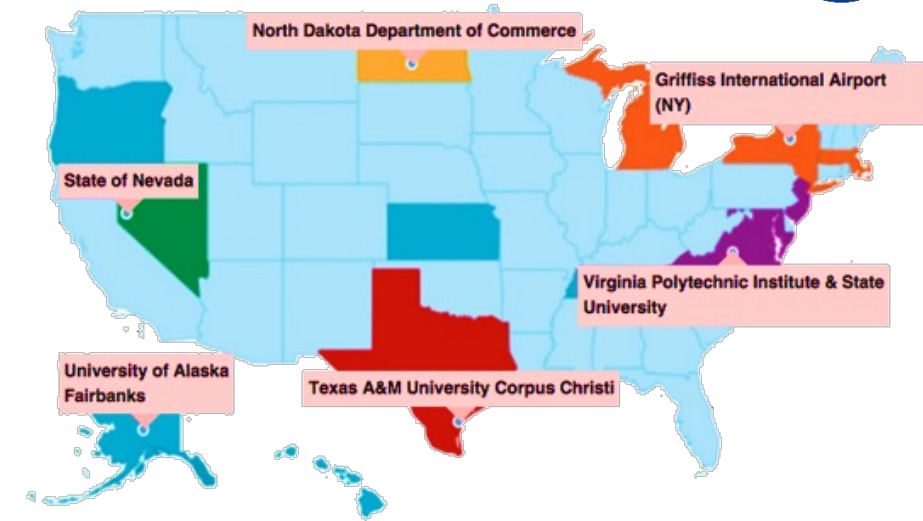

TCL 2 National Campaign

May 15th – June 9th 2017

- ❑ ~40 partners total across 6 testing locations
- ❑ 6 USS Implementers (Amazon Prime Air, Google Project Wing, Airmap, Simulyze, ANRA, NASA)
- ❑ NASA USS and FIMS run in the cloud
- ❑ Data feeds monitored in UTM lab and at each location
- ❑ Multiple Media days

Test Sites	USS Technology	Geofence Technology	Ground-based Sense & Avoid	Airborne Sense & Avoid	Communication, Navigation, Surveillance	Human Factors
Alaska	✓	✓	✓	✓	✓	✓
Nevada	✓	✓	✓	✓	✓	✓

Constraints

Summary

UAS Traffic Management is an automated cloud-based “air traffic management” ecosystem for uncontrolled airspace where services do not exist

TCL 2 Demonstration and TCL 2 National Campaign successfully showed the feasibility of supporting multiple BVLOS operations in a rural environment, engaged industry to contribute to the development of UTM and highlighted areas of future research

Next Steps will evaluate the effectiveness and interoperability of technologies to support separation, communication, navigation, data-exchange, and airspace management in more complex operational environments (suburban and urban)
